# ◆ Circular economy,

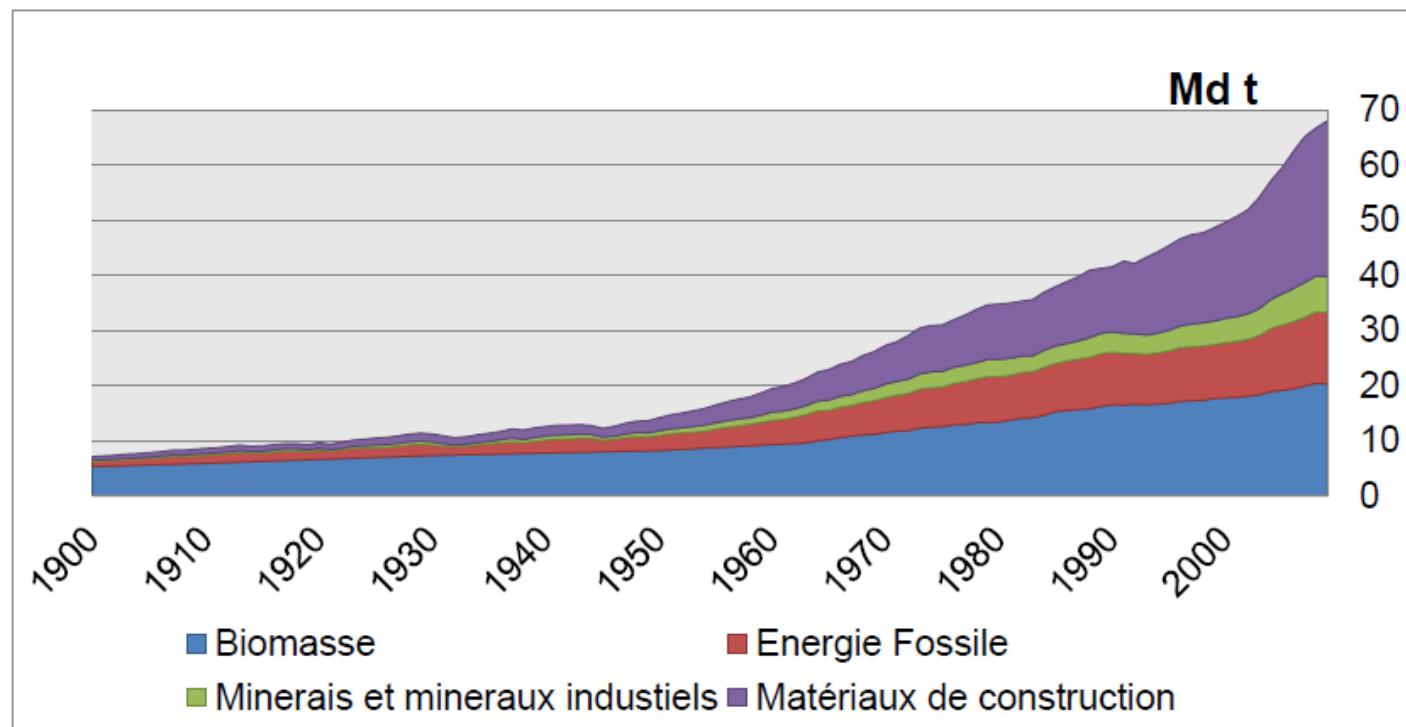

**Circular Economy** : an economical production and exchange system aiming, for the whole lifecycle of a product, (good and service) at increasing efficiency and decreasing environnemental impacts.

(ADEME 2015)

a systemic approach of the material urban area functionning to find efficient mass ans energy use.

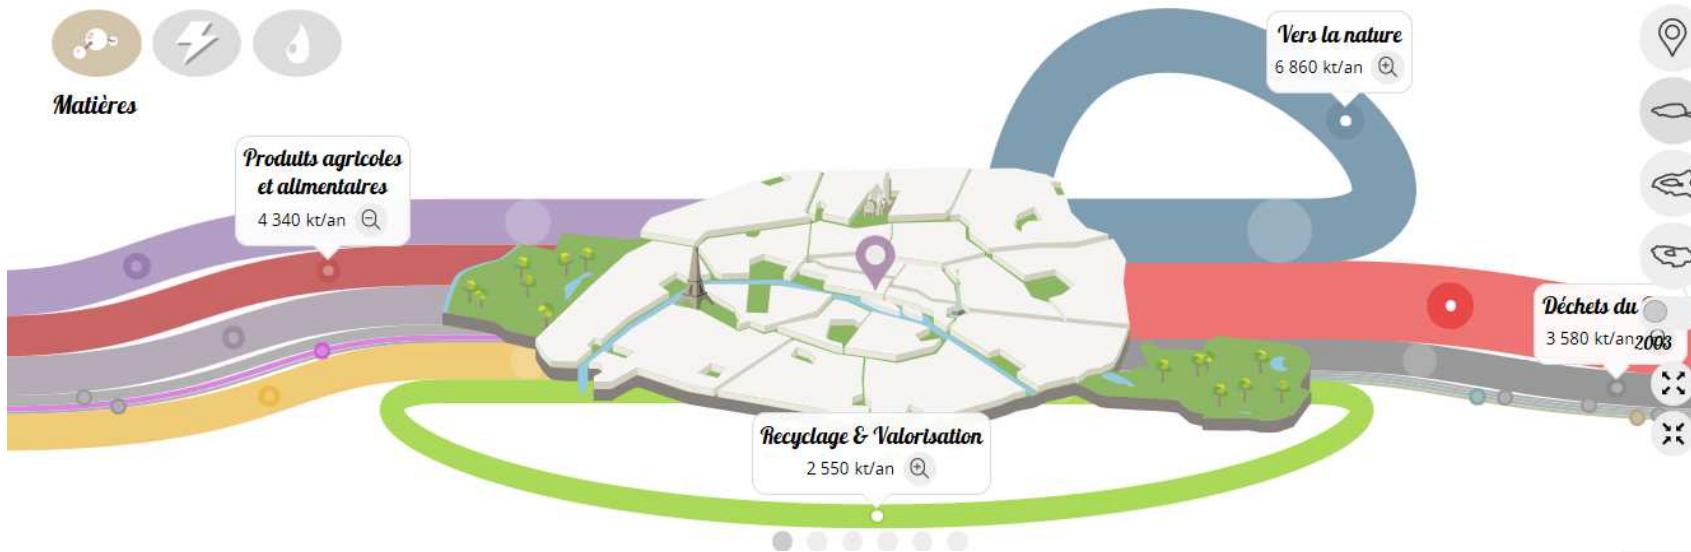

Biomass :

- the second material flow used by the current linear economy
- an important part of this biomass flow is for food-industry productions

Source Krausman et al, 2009, M&J 2011

# ◆ Circular economy and cities

*Urban metabolism of Paris on <http://metabolisme.paris.fr>, based on Barles 2003*

Modern european cities :

- Food flows are one of the main flows,
- The biggest solid waste flow, wastes from construction industry,
- A main component : excavated soils.

In the past, urban areas development limited by the food supply. Today , food autonomy development becomes a tool for initiate circular economy transition with for the biomass flow :

- Local productions with better economic and environmental impacts
- Solution for some city's excretas (organic wastes, soils...)

## ◆ Example 1 : urban farming project, an efficient « first step » to circular economy approach

Urban farming project from the Grand Paris Sud Seine Essonne agglomeration. An urban planning project for industrial and agricultural wasteland :

- housing and commerce project (8ha)
- agricultural project : 19ha dedicated to agriculture and green spaces.

The systemic approach shared with the local authorities allows to ask questions on interactions between the two sub-projects :

- How to supply inhabitants of the agglomeration?
- How to supply public food service?
- How to supply the agricultural area (organic fertilizer...)?...

Livre Blanc : L'économie circulaire, un atout pour relever le défi de l'aménagement durable des territoires !, ADEME 2017

## Example 2 : Urban farming : a solution to the main waste problem : excavated soils

*Source : Ourcq fertile*

Paris

30 km from Paris

Excavated soils  
from construction  
and building works  
: infertile

Fertilization of  
these new soils

Agricultural productions  
(fruits, vegetables, meat...)
